

Project Title

AUSHADH: Smart Medicine Box

Project Brief

AUSHADH is a compact smart medicine box that confirms pill consumption rather than just reminding patients. FSR weight sensors beneath each compartment detect actual pill removal — no cameras, no assumptions.

Powered by an ESP32 with Wi-Fi, it syncs adherence data to the cloud for real-time caregiver monitoring. A buzzer, LED indicators, and LCD display deliver multi-modal alerts, while a 4x4 keypad handles schedule setup.

14 compartments cover a full week of twice-daily doses simple, affordable, and completely privacy-friendly.

About

AUSHADH was developed with the goal of transforming medication management from a passive reminder system into an active, confirmation-based solution. Existing systems rely on alarms and app notifications, which can be ignored without any way to verify actual consumption. This project addresses those gaps by introducing a sensor-driven device that confirms real pill removal through weight sensing and instantly notifies caregivers when a dose is missed.

It is especially useful for:

- Elderly patients on daily medications
- Chronic illness & multi-drug regimens
- Home care and assisted living settings

AUSHADH represents a step toward affordable, privacy-friendly, and dependable smart healthcare technology.
